Construction Estimates without **Counting, Measuring, or Scaling!**

New Software Revolutionizes Electrical Design & Estimating for Design-Build Firms

Recycling depots nationwide were overwhelmed yesterday with tens of thousands of adding machines and rulers. Our investigative reporter, Dan Rathernot, received this comment from Wile E. Estimator of Acme Design-Build as he was gleefully disposing of his adding machine and rulers:

"Estimating has ruined my vision and given me Carpal Tunnel Syndrome. With this new DraftLogic Electrical software, I can finally get on the road to recovery and do my job faster than ever!"

Dan investigated the strange occurrence further and discovered that although desktop computers and computer aided design software became available over twenty-five years ago, construction estimators until last week were still measuring, counting, and scaling from floor plans to do their work. The recent release of DraftLogic Electrical has thus revolutionized the estimating industry. No longer do estimators need to waste valuable time and energy on counting, measuring, and scaling-DraftLogic Electrical fully automatically draws multi-circuit branch circuit wiring & generates a complete bill of materials for the project.

DraftLogic

Electrical Designer
BREAKS
GINESS RECORD
For Project Completion

The Giness World Record for building electrical design was shattered today by Youcould Beme, an electrical designer in Boston. Youcould completed the building electrical systems design and documents package on a 60,000ft2 school from start to finish in only eight hours, smashing the previous record of 32 hours set by SweatyCAD Guy last year. YouCould Beme had this to say:

"I had some help from my little friend, DraftLogic Electrical! The Automated Placement helped me get the system devices where I needed, but the real boost was after that-Automated Circuiting, Automated Branch Circuit Wiring, Panel Schedules, Single Line Diagram, Floor Plans, Mechanical Schedule, Bill of Materials, Lighting Wattage Per ft2 per room, and more all took mere minutes."

We contacted SweatyCAD Guy to let him know of the throwing of his defeated record onto the Mountain of Shame. He had some choice comments for us:

"I don't understand…I tore tendons in my mouse hand I was moving so fast to make my record. I was even using the best LISP custom tools money could buy last year and the newest version of AutooCAD MEEP. How could this Youcould fellow beat me so badly? And what are you talking about this 'Mountain of Shame'? I'm going to fly to your office and [censored] your [censored]!!!"
Fear not, dear readers. We have retained the best in security personnel to guard our building.

Soviet Union Spy Arrested Carrying
Secrets of Link Between
ConEst IntelliBid and DraftLogic Electrical

Travelers in JFK Airport yesterday were shocked to witness the CIA take-down of an alleged Soviet Union spy. Boris Bondrovich was arrested on charges of espionage for the theft of electrical design game-changing technology from DraftLogic and ConEst.

Representatives of each company were surprised to learn that 'friendly Boris who was supposedly rebalancing the office HVAC after hours' was actually hacking into their computer network and stealing the source code for each of their revolutionary software products.

Our anonymous CIA source advised us Boris finally cracked after hours of wakeboarding interrogation & confessed to his crimes. Boris stated that his Moscow handler wanted the DraftLogic Electrical and ConEst IntelliBid software source code because 'the integration of these products announced and demonstrated at NECA Boston will provide Design-Build firms a whole new level of design and estimating efficiency'.
